## 1 Problem setting

### 1.1 fractal boundary with a few steps of Koch snowflake

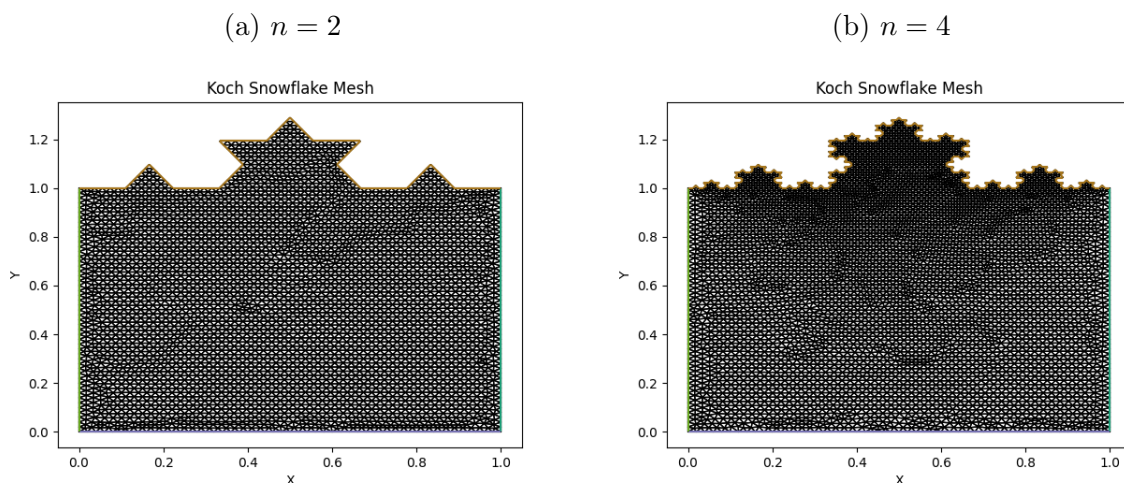

Figure 1: Unit square with the top edge replaced by a Koch snowflake with  $n$  iterations.

2D: Let  $n$  be the number of iterations in the snowflake (See Fig. 1, meshsize=0.02 for all vertices in .geo). The total number of small sides is  $4^n$  and the small length scale  $l = \left(\frac{1}{3}\right)^n$ . Thus, the perimeter of the snowflake  $L_p = \left(\frac{4}{3}\right)^n$ .

Python script for creating the 2D mesh: snow\_square.py.

3D: Let  $n$  be the number of iterations in the snowflake (See Fig. 2, meshsize=0.1 for all vertices in .geo). The total number of small squares is  $13^n$  and the small area is  $l = \left(\frac{1}{9}\right)^n$ . Thus, the perimeter of the snowflake  $L_p = \left(\frac{13}{9}\right)^n$ .

Python script for creating the 3D mesh: snow\_cube.py.

(a)  $n = 2$ (b)  $n = 3$ Figure 2: Unit cube with the top surface replaced by a Koch snowflake with  $n$  iterations.

## 1.2 PDEs

Solve

$$-\operatorname{div}(D\operatorname{grad}u) = 0 \quad \text{on } \Omega \quad (1.1)$$

$\Omega$ :

(a) the unit square in which the top edge has been replaced by a prefractal.

(b) the unit cube in which the top face is replaced by a prefractal.

Boundary conditions:

(a) on bottom edge, Dirichlet:  $u = 1$ .

(b) on sides, homogeneous Neumann:  $\frac{\partial u}{\partial n} = 0$ .

(c) on prefractal top edge, Robin boundary conditions:  $\Lambda \frac{\partial u}{\partial n} + u = 0$ .

The total flux through the top edge:

$$\Phi := \int_{top} -D \frac{\partial u}{\partial n} d\sigma = \frac{D}{\Lambda} \int_{top} u d\sigma.$$

We need to see how  $\Phi$  depends on  $\Lambda$  for  $0 \leq \Lambda \leq 2L_p$ .

## 2 Test firedrake solver on 2D and 3D

Consider the Laplace equation  $-\operatorname{div}(D\operatorname{grad}u) = f$  with non homogeneous condition:

(a) on bottom edge/surface, Dirichlet:  $u = g$ .

(b) on sides, homogeneous Neumann:  $\frac{\partial u}{\partial n} = k$ .

(c) on prefractal top edge/surface, Robin boundary conditions:  $\Lambda \frac{\partial u}{\partial n} + u = l$ .

The weak formulation: Find  $u \in H^1$  with  $u = g$  on bottom such that

$$\int_{\Omega} D \text{grad}(u) \cdot \text{grad}(v) dx + \int_{\text{top}} \frac{D}{\Lambda} u v ds = \int_{\Omega} f v dx + \int_{\text{top}} \frac{1}{\Lambda} l v ds + \int_{\text{sides}} k v ds, \quad \forall v \in H_0^1$$

In Fig. 3, we plot the error in  $L^2$  and  $H^1$  norm with respect to mesh size  $h$ . The manufactured solution is  $u(x, y) = 2 + x^2 + y$  on the unit square with snowflake ( $n = 4$  iterations). The Lagrange linear element is used. The uniform refinement is done by built-in function MeshHierarchy.

The test python script on 2D is: test-robin-solver.py.

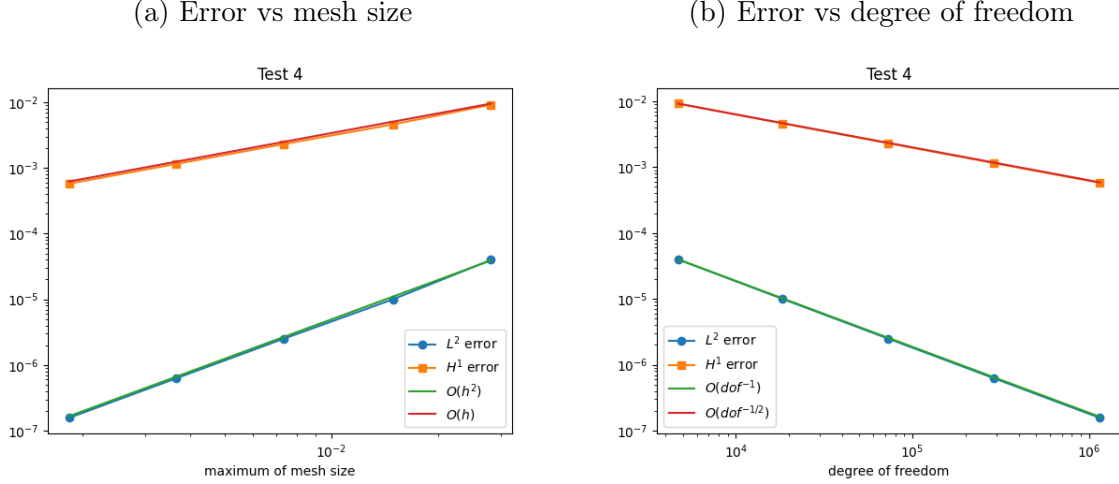

Figure 3: Unit square: Solution  $u = x^2 + y + 2$ .

In Fig. 4 and Fig. 5, we plot the error in  $L^2$  and  $H^1$  norm with respect to mesh size  $h$  and degree of freedom where domain is unit cube with snowflake ( $n = 3$  iterations). In Fig. 4, the manufactured solution is  $u(x, y, z) = 2 + x + 3y + z$ . In Fig. 5, the manufactured solution is  $u(x, y, z) = 2 + x^2 + 3xy + yz$ . The Lagrange linear element is used. The uniform refinement is done by built-in function MeshHierarchy.

The test python script on 3D is: test-robin-solver-cube.py. The script is run by the following parallelsim command

```
mpiexec -n 16 python test-robin-solver-cube.py
```

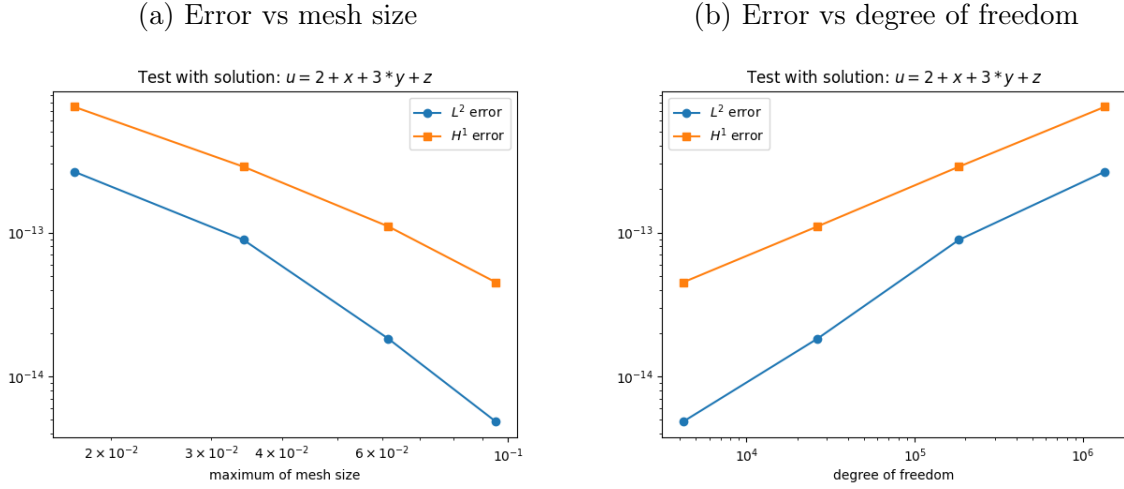

Figure 4: Unit cube: Solution  $u = 2 + x + 3y + z$ . Linear finite element.

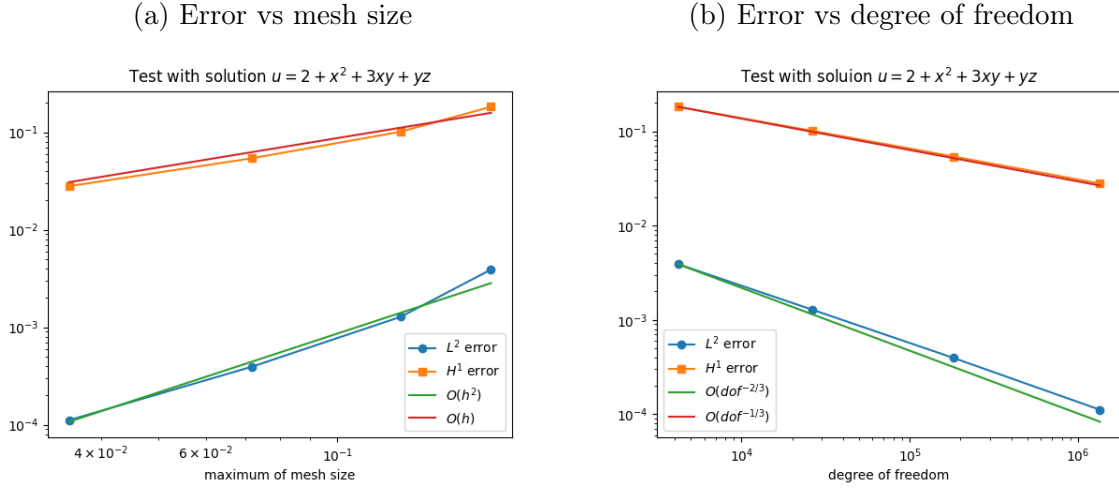

Figure 5: Unit cube. Solution  $u = 2 + x^2 + 3xy + yz$ . Linear finite element.

### 3 $\Omega$ is unit square and $\mathbf{D}$ is constant

Now, we solve the PDE (1.1) on 2D unit square using firedrake with the finest mesh in Fig. ???. In Fig. 6, we plot the flux  $\Phi = \int_{top} -D \frac{\partial u}{\partial n} d\sigma$  with different choice of  $\Lambda$ .

(a) Solution when  $D = 1, \Lambda = 1$ (b) Total flux vs  $\Lambda$ 

Figure 6: Snowflake with  $n = 4$  iterations. (a). Solutions. (b) Total flux vs  $\Lambda$  when  $D = 1$ . Python script: `main_flux.py`.

## 4 $\Omega$ is unit cube and D is constant

Now, we solve the PDE (1.1) on 3D unit cube using firedrake with the finest mesh in Fig. ???. In Fig. 7, we plot the flux  $\Phi = \int_{top} -D \frac{\partial u}{\partial n} d\sigma$  with different choice of  $\Lambda$ .

(a) Total flux vs  $\Lambda$ 

Figure 7: Snowflake with  $n = 3$  iterations on Cube. Total flux vs  $\Lambda$  when  $D = 1$ . Python script: `main_flux.py`.

## 5 Fractal boundary with Dirichlet Boundary conditon

In this section, we solve the PDE

$$-\Delta u = f \quad \text{on } \Omega \quad (5.1)$$

with  $u = 0$  on  $\partial\Omega$ . Here,  $\Omega$  is a unit square where each edges are replaced by the Koch snowflake (See Fig. 8).

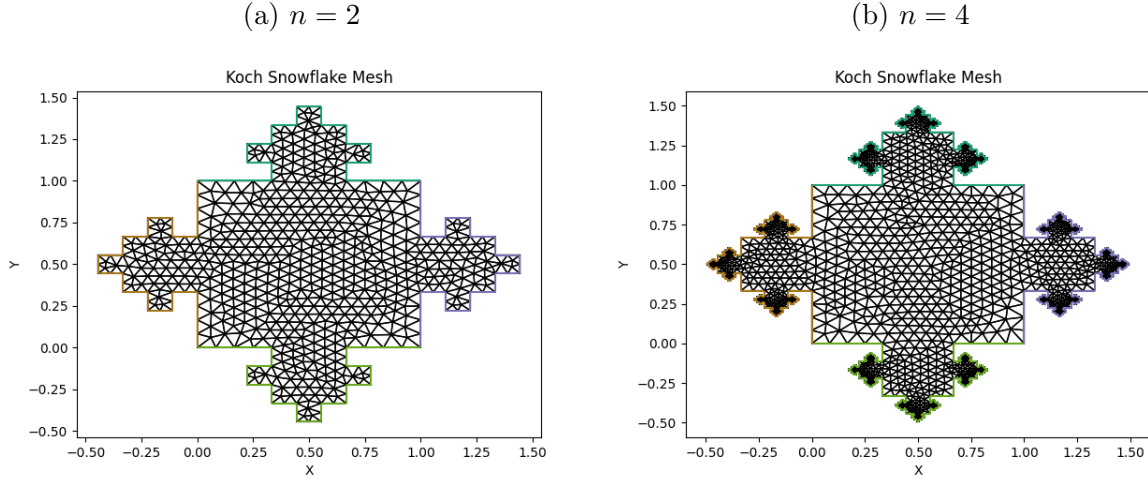

Figure 8: Unit square with each edges replaced by a Koch snowflake with  $n$  iterations. Meshsize is 0.1 for each vertices in .geo file.

In Fig. 9 and Fig. 10, we plot the error in  $L^2$  and  $H^1$  norm with respect to mesh size  $h$  and degree of freedom where domain is unit cube with snowflake ( $n = 3$  iterations). In Fig. 9, the manufactured solution is  $u(x, y) = 2 + x + 3y$ . In Fig. 10, the manufactured solution is  $u(x, y, z) = 2 + x^2 + y$ . The Lagrange linear element is used. The uniform refinement is done by built-in function MeshHierarchy.

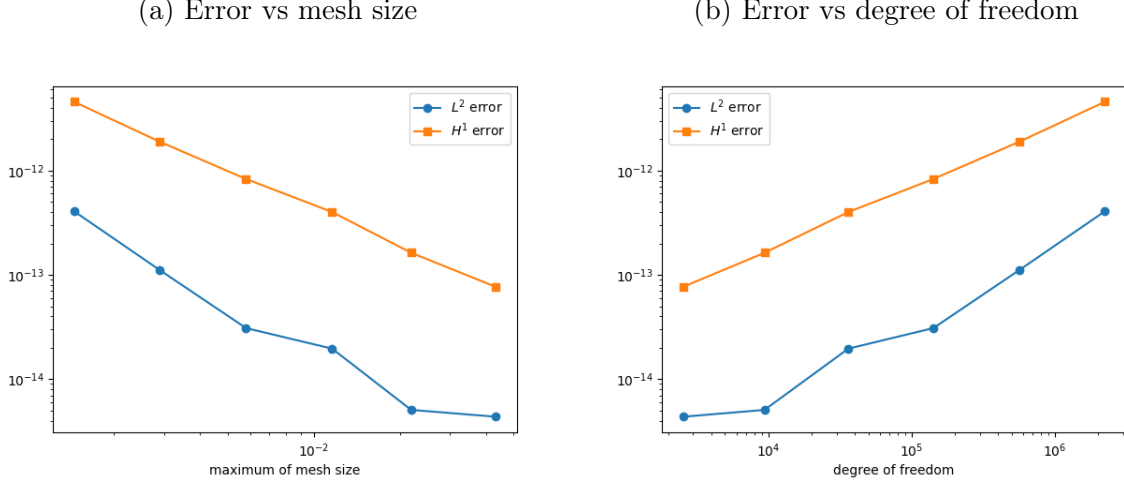

Figure 9: Unit square: Solution  $u = x + 3y + 2$ . linear finite element space

Figure 10: Unit square: Solution  $u = x^2 + y + 2$ . linear finite element space

In Fig. 11(b), we plot the solution of the PDE (5.1) with  $f$  defined as in Fig. 11(a).

Figure 11: On unit square with snowflake. (a). force term  $f$ . (b) solution of the PDE (5.1).

Figure 12: On unit square with snowflake. Evaluation of solution at a sequence points  $\{\mathbf{x}_i\}_{i=0}^4$  where  $\mathbf{x}_i$  is the center of the square from  $i$ -th snowflake iteration.
